Batch Size = 256, epochs = 200, Acc on train data = 52.84 %, Acc on valid data = 53.16% 訓練過程: 一直到 epoch 63 時,train & valid 的 accuracy 一直卡在 25%左右,而後 就一直上升,但是跑完 200 epoch 時似乎還沒收斂,但是因為我的mac實在 train不動,HTC deepQ 平台只要我參數太多,就會有 ran out of memory的情況,太晚開始用 deepQ平台,不得已只好先跑這樣...

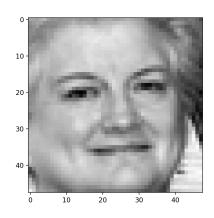

- 2. (1%) 承上題,請用與上述 CNN 接近的參數量,實做簡單的 DNN model。其模型架構、訓練過程和準確率為何?試與上題結果做比較,並說明你觀察到了什麼?
- 3. (1%) 觀察答錯的圖片中,哪些 class 彼此間容易用混?

看得出來,正確率最低的是 Disgust,很容易辨識成 Angry、Fear 和 Sad。

而正確率最高的則是 Happy和 Surprise, 我猜應該是這兩個 class 的臉部表情較為明顯, 所以比較不容易辨識錯誤。

4. (1%) 從(1)(2)可以發現,使用 CNN 的確有些好處,試繪出其 saliency maps,觀察模型在做 classification 時,是 focus 在圖片的哪些部份?

5. (1%) 承(1)(2),利用上課所提到的 gradient ascent 方法,觀察特定層的filter最容易被哪種圖片 activate。
